GitHub: github.com/Holar012/ai-data-annotation-portfolio05

Portfolio scope

Selected independent practice samples showing how I apply a schema, document decisions and review annotation quality. The examples use synthetic or recreated data and contain no confidential client material. Updated October 2026.

The LLM comparison is an AI-assisted demonstration prepared for my review. Video frame ranges are illustrative until paired with source footage. These samples are not client deliverables or independently measured production results.

Samples included

Sample	Evidence
NER	Exact entity spans and machine-readable JSONL
Classification	Sentiment and intent decisions with rationales
Relations	Explicit relationships and a no-relation example
Video and image	Practice conventions and explanatory visual
LLM evaluation	Source-grounded comparison and preference rationale
Quality review	Documented issues, corrections and checks

Relevant background

BSc Computer Science, University of Benin. Relevant study: Machine Learning, Natural Language Processing, Algorithms and Data Structures.

COSMIC365.AI: May 2022 to present. Teknesis: February 2021 to April 2022. Dates align with my current CV.

Practice tools: Doccano, CVAT, MakeSense.ai and Docker Desktop. Certificates listed in my current CV include Prompt Engineering for ChatGPT (2025), Google AI Essentials (2024), Responsible AI Practices (2024), AI for Everyone (2023) and Data Annotation Fundamentals (2022).

NLP annotation samples

Named entity recognition

Aisha joined Microsoft in London in March 2026.

Text span	Label	Start	End
Aisha	PERSON	0	5
Microsoft	ORG	13	22
London	LOCATION	26	32
March 2026	DATE	36	46

Offsets are zero-based; the start is inclusive and the end is exclusive. Label exact entity spans and exclude surrounding punctuation. Relative dates require an explicit schema rule. Ambiguous mentions should be flagged rather than forced into a class.

Sentiment and intent classification

Text	Sentiment	Intent labels
The service was excellent and the agent solved my issue quickly.	POSITIVE	PRAISE
Please cancel my subscription and refund this month's charge.	NEUTRAL	CANCELLATION + REFUND
What documents do I need to verify my account?	NEUTRAL	INFO_REQUEST
I was charged twice and nobody has responded to my complaint.	NEGATIVE	COMPLAINT

Decision rationale

The cancellation/refund request is NEUTRAL because it gives procedural instructions without expressing dissatisfaction. Both intents are explicit. The double-charge complaint is NEGATIVE and COMPLAINT; REFUND is not assigned because the sentence does not request money back.

For single-label practice, CANCELLATION takes priority when both cancellation and refund are explicit. This documented tie-break belongs to this exercise; employer guidelines take precedence.

Relations and quality review

Relation extraction

Sentence	Relation	Direction
Maya works for Northstar Analytics.	WORKS_FOR	Maya → Northstar Analytics
Samuel studies at King's College London.	STUDIES_AT	Samuel → King's College London
Northstar Labs is located in London.	LOCATED_IN	Northstar Labs → London
Liam visited Oxford University during a conference.	NO_RELATION	Visit does not establish study or employment

Only assign a relation supported by the sentence. "Joined Northstar Labs in London" does not unambiguously establish the company's location; the example above makes that relationship explicit.

Documented portfolio QA audit

Issue found	Correction	Reason
Cancellation and refund request labelled NEGATIVE	Changed to NEUTRAL	No expressed negative judgement under the documented practice rule.
Billing complaint assigned REFUND without request	Removed REFUND	Complaint does not independently support a refund intent.
Guideline and export used different transition labels	Aligned both to CUT, DISSOLVE, FADE, NO_TRANSITION	The practice schema must match the exported labels.
Cut frame recorded separately from the next shot	New shot begins at cut boundary frame 64	A hard cut is a boundary event, not a separate transition interval.
Scene counts stated without source footage	Changed to UNKNOWN	Shot boundaries do not establish scene count.

This audit documents corrections made to demonstration materials during this portfolio review. It is not an employer QA report or independent benchmark. No accuracy percentage is claimed. The complete audit is included in the GitHub-ready files.

Final checks

Check allowed labels, exact spans, independent evidence for each intent and relation, ordered frame ranges and agreement between guidance and exports. Record unresolved ambiguity and follow the project escalation process.

Video shot and transition annotation

Illustrative frame annotations using a consistent practice schema. Source footage is not included, so these ranges should not be treated as independently verified visual annotations.

Annotation conventions

Frames are zero-based and ranges are inclusive. Stable shot ranges exclude gradual transition intervals. A hard cut is a boundary event: its frame is the first frame of the next shot. Camera movement or zoom alone does not create a new shot.

Example	Shot 1	Transition	Shot 2	Label
A	0-59	60-68	69-127	DISSOLVE
B	0-47	48-56	57-127	FADE
C	0-63	Boundary 64	64-110	CUT
D	0-127	None	None	NO_TRANSITION

Allowed labels

Label	Definition
CUT	Immediate editorial change; record the next shot's first frame.
DISSOLVE	Both shots visibly blend across a gradual transition.
FADE	Progressive darkening or brightening; combined class for this exercise.
NO_TRANSITION	Continuous footage without an editorial transition.

A production project may use separate FADE_IN and FADE_OUT classes. Apply its schema rather than this practice convention. Scene count remains UNKNOWN until source footage and a scene definition support it.

Frame level quality checks

Inspect difficult boundaries frame by frame. Ensure stable shots and transition intervals do not overlap or omit frames. Confirm the cut boundary matches the new shot's first frame. Review scene grouping separately from shot counting.

Evidence to add

A short public or self-created video, a CVAT screenshot and the matching export would allow a recruiter to check the visual decisions against the frame annotations.

Image annotation demonstration

Practice visibility rule

For this synthetic exercise, annotate CHAIR, TABLE and SOFA when at least 40% of the object is visible. The rule is specific to this example; project definitions override it.

The coloured outlines are explanatory markers. The red outline around the bed identifies an excluded object for teaching purposes; it is not an annotation submitted to the dataset. Visibility percentages are illustrative, not measured from this schematic.

Object	Illustrative visibility	Decision
Chair	Fully visible	Annotate CHAIR
Table	About 45%	Annotate TABLE
Sofa	About 75%	Annotate SOFA
Bed	About 35%	Exclude below the practice threshold

Quality checks

For an actual export, retain only included objects. Check tight boxes around the visible object, correct classes, no duplicates and consistent treatment of occlusion. An original tool screenshot and exported coordinates would provide stronger evidence than this schematic alone.

LLM response evaluation

AI-assisted synthetic demonstration prepared for author review. This benign summarisation task uses a simple practice rubric; it is not a client task or measured production result.

Prompt

Summarise the supplied notice in exactly two bullet points. Include the closure date and reopening time. Do not add facts.

Source notice

The town library will be closed on Monday 12 October 2026 for maintenance. It will reopen at 9 am on Tuesday 13 October 2026. Online services remain available.

Response A

- The town library is closed on Monday 12 October 2026 for maintenance.
- It reopens at 9 am on Tuesday 13 October 2026; online services remain available.

Response B

The library is closed all week for renovations. It reopens next Monday at 10 am. Members will receive a refund.

Rubric assessment

Criterion	Response A	Response B
Factual accuracy	PASS	FAIL: wrong duration and reopening details
Instruction following	PASS: exactly two bullets	FAIL: no bullet format
Completeness	PASS: both required details	FAIL: incorrect required details
Unsupported claims	None	Invented refund and closure details

Preference rationale

A is preferred because it follows the two-bullet format and accurately includes the closure date and reopening time. B changes the closure to a full week, gives an incorrect reopening day and time, and invents a refund. It also ignores the requested bullet format. A is grounded in the notice and includes both required details.

Limits of this sample

This example shows an evaluation format and source-based reasoning. It does not prove previous client performance. My own reviewed comparisons, with permission to share them, would provide stronger evidence.
